Question 1

Correct

Mark 10.00 out of 10.00

We define super digit of an integer x using the following rules:

Given an integer, we need to find the *super digit* of the integer.

- If x has only **1** digit, then its super digit is x .
- Otherwise, the super digit of x is equal to the super digit of the sum of the digits of x .

For example, the super digit of **9875** will be calculated as:

```
super_digit(9875)    9+8+7+5 = 29
super_digit(29)      2 + 9 = 11
super_digit(11)      1 + 1 = 2
super_digit(2)       = 2
```

Example

$n = '9875'$

$k = 4$

The number p is created by concatenating the string n k times so the initial $p = 9875987598759875$.

```
superDigit(p) = superDigit(9875987598759875)
               9+8+7+5+9+8+7+5+9+8+7+5+9+8+7+5 = 116
superDigit(p) = superDigit(116)
               1+1+6 = 8
superDigit(p) = superDigit(8)
```

All of the digits of p sum to **116**. The digits of **116** sum to **8**. **8** is only one digit, so it is the super digit.

Function Description

Complete the function *superDigit* in the editor below. It must return the calculated super digit as an integer.

superDigit has the following parameter(s):

- *string n*: a string representation of an integer
- *int k*: the times to concatenate n to make p

Returns

- *int*: the super digit of n repeated k times

Input Format

The first line contains two space separated integers, n and k .

Constraints

- $1 \leq n < 10^{100000}$
- $1 \leq k \leq 10^5$

Sample Input 0

```
148 3
```

Sample Output 0

```
3
```

Explanation 0

Here $n = 148$ and $k = 3$, so $p = 148148148$.

```
super_digit(P) = super_digit(148148148)
                = super_digit(1+4+8+1+4+8+1+4+8)
                = super_digit(39)
                = super_digit(3+9)
                = super_digit(12)
                = super_digit(1+2)
                = super_digit(3)
                = 3
```

Sample Input 1

9875 4

Sample Output 1

8

Sample Input 2

123 3

Sample Output 2

9

Explanation 2

Here $n = 123$ and $k = 3$, so $p = 123123123$.

```
super_digit(P) = super_digit(123123123)
                = super_digit(1+2+3+1+2+3+1+2+3)
                = super_digit(18)
                = super_digit(1+8)
                = super_digit(9)
                = 9
```

For example:

Input	Result
148 3	3
9875 4	8
123 3	9

Answer: (penalty regime: 0 %)

```
for (size_t i = 0; i < n.size(); i++) {
    ans += n[i] - '0';
}
ans = (ans * (k % 9)) % 9;
if (ans == 0 && k > 1) {
    return 9;
}
return ans;
}

int main()
{
    ofstream fout(getenv("OUTPUT_PATH"));

    string first_multiple_input_temp;
    getline(cin, first_multiple_input_temp);

    vector<string> first_multiple_input =
```

	Input	Expected	Got	
✓	148 3	3	3	✓
✓	9875 4	8	8	✓
✓	123 3	9	9	✓

Correct

Marks for this submission: 10.00/10.00.

Question 2

Correct

Mark 10.00 out of 10.00

Find the number of ways that a given integer, X , can be expressed as the sum of the N^{th} powers of unique, natural numbers.

For example, if $X = 13$ and $N = 2$, we have to find all combinations of unique squares adding up to 13 . The only solution is $2^2 + 3^2$.

Function Description

Complete the *powerSum* function in the editor below. It should return an integer that represents the number of possible combinations.

powerSum has the following parameter(s):

- X : the integer to sum to
- N : the integer power to raise numbers to

Input Format

The first line contains an integer X .

The second line contains an integer N .

Constraints

- $1 \leq X \leq 1000$
- $2 \leq N \leq 10$

Output Format

Output a single integer, the number of possible combinations calculated.

Sample Input 0

```
10
2
```

Sample Output 0

```
1
```

Explanation 0

If $X = 10$ and $N = 2$, we need to find the number of ways that 10 can be represented as the sum of squares of unique numbers.

$$10 = 1^2 + 3^2$$

This is the only way in which 10 can be expressed as the sum of unique squares.

Sample Input 1

```
100
2
```

Sample Output 1

```
3
```

Explanation 1

$$100 = (10^2) = (6^2 + 8^2) = (1^2 + 3^2 + 4^2 + 5^2 + 7^2)$$

Sample Input 2

```
100
3
```

Sample Output 2

```
1
```

Explanation 2

100 can be expressed as the sum of the cubes of $1, 2, 3, 4$.

$(1 + 8 + 27 + 64 = 100)$. There is no other way to express 100 as the sum of cubes.

For example:

Input	Result
10 2	1
100 2	3
100 3	1

Answer: (penalty regime: 0 %)

```
int power (int a, int n) {
    if(n == 0)
        return 1;
    if(n % 2 == 0) {
        int temp = power(a, n / 2);
        return temp * temp;
    }
    return a * power(a, n - 1);
}

int solve(int x, const vector<int> &powers, int index)
{
    if(index == 0) {
        return (x == 1) ? 1 : 0;
    }
    if(x == powers[index])
        return 1 + solve(x, powers, index - 1);
    int res = 0;
```

	Input	Expected	Got	
✓	10 2	1	1	✓
✓	100 2	3	3	✓
✓	100 3	1	1	✓
